# Plan of the talk

- Fractional quantum Hall effect (FQHE) in the Lowest Landau level (LLL): composite fermion (CF) theory
- New collective mode in certain FQHE states: parton mode
- Emergent SUSY at 5/2
- Conclusion and outlook

# Advent of FQHE: plateau at $h/(\frac{1}{3}e^2)$

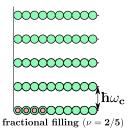

D. C. Tsui, H. L. Stormer, and A. C. Gossard, Phys. Rev. Lett. 48, 1559 (1982)

イロト イヨト イヨト イヨト

# Laughlin's ansatz for u = 1/m

assumed a Jastrow (pairwise) correlated state.

$$\Psi^{ ext{Laughlin}}_{1/m} = \prod_{i < j} (z_i - z_j)^m$$

- fermionic wave functions must be antisymmetric, hence m is odd integer
- fluid with fractionally charged particles obeying fractional braid statistics

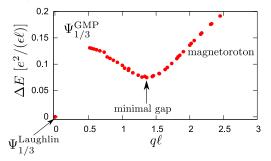

R. B. Laughlin, Phys. Rev. Lett. 50, 1395 (1983)

Ajit C. Balram cb.ajit@gmail.com

SUSY at  $\nu = 5/2$ 

### Density-mode ansatz for the neutral excitation

$$\begin{split} \Psi_{\nu}^{\text{GMP}} &= \bar{\rho}_{\vec{q}} \Psi_{\nu} \text{ [single-mode approximation (SMA)]} \\ \bar{\rho}_{\vec{q}} \text{ is the LLL projected density operator} \end{split}$$

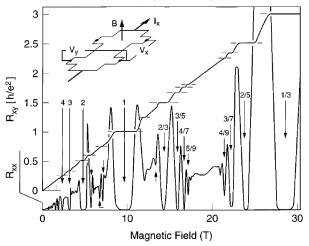

Girvin, MacDonald, and Platzman (GMP), Phys. Rev. Lett. 54, 581 (1985), Phys. Rev. B 33, 2481 (1986) Experimentally observed using light-scattering

A. Pinczuk, B. S. Dennis, L. N. Pfeiffer, and K. West, Phys. Rev. Lett. 70, 3983 (1993)

Ajit C. Balram cb.ajit@gmail.com

### Zoo of fractions in the $\nu = n/(2pn\pm 1)$ sequence

J. P. Eisenstein and H. L. Stormer, Science 248, 4962, 1510-1516 (1990)

Ajit C. Balram cb.ajit@gmail.com

# FQHE as IQHE of composite fermions

A composite fermion (CF) is a bound state of an electron and even number of vortices/flux quanta.

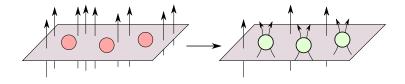

J. K. Jain, Composite Fermions, Cambridge University Press (2007)

Ajit C. Balram cb.ajit@gmail.com

SUSY at 
$$\nu = 5/2$$

э

### FQHE as IQHE of composite fermions

$$B^*=B-2p
ho\phi_0, \quad \phi_0=hc/e$$

$$\nu = \frac{\rho \phi_0}{B}, \quad \nu^* = \frac{\rho \phi_0}{|B^*|}, \quad \nu = \frac{\nu^*}{2p\nu^* \pm 1}$$

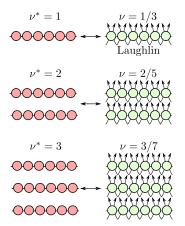

J. K. Jain, Composite Fermions, Cambridge University Press (2007)

### FQHE wave functions can be built from IQHE ones

• Jain wave functions at  $\nu = n/(2pn \pm 1)$ :

$$\Psi_{\nu=\frac{n}{2\rho n\pm 1}}^{\rm CF} = \mathcal{P}_{\rm LLL}\Big(\Phi_{\pm n}\prod_{i< j}(z_i-z_j)^{2p}\Big).$$

(dropped Gaussian factor for ease of notation)

 $\Phi_n$  wave function of *n* filled LLs.

 $\mathcal{P}_{LLL}$  implements lowest Landau level projection.

- no adjustable parameters in these wave functions
- wave functions can be evaluated for large system sizes

J. K. Jain, Phys. Rev. Lett. 63, 199 (1989)

### Overlaps of CF states with LLL Coulomb ground states

### overlaps obtained from direct projected states

ν	Ν	Hilbert space dimension	$ \langle \Psi^{0\mathrm{LL}} \Psi^{\mathrm{CF}} angle $
1/3	15	$2 imes 10^9$	0.9876 (Laughlin)
1/5	11	$4 imes 10^8$	0.9413 (Laughlin)
2/5	12	$3 imes 10^5$	0.9971
3/7	12	$6 imes 10^4$	0.9988
2/9	10	$1  imes 10^7$	0.9744

 $|\Psi^{
m 0LL}
angle$  is obtained by brute-force exact diagonalization

### A puzzle in the $n/(4n \pm 1)$ secondary Jain states

Present composite fermion field theories for the secondary Jain state states violate the so-called "Haldane bound," which places a lower bound on the coefficient of  $q^4$  in the static structure factor  $(\langle \bar{\rho}\bar{\rho} \rangle)$  set by the shift. requires lowest Landau level (LLL) projection

H. Goldman and E. Fradkin, Phys. Rev. B 98, 165137 (2018).

 Nguyen and Son proposed that, in addition to the GMP mode, there exist additional, higher energy collective modes, which resolves this contradiction.

Dung Xuan Nguyen and Dam Thanh Son, Phys. Rev. Research 3, 033217 (2021)

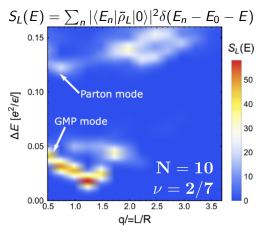

We give a microscopic justification and construct a trial wave function to capture this additional "parton" mode.

### Parton states: product of fermionic states

 break each electron into fictitious partons, place partons into IQH (or any) fermionic states, fuse the partons back to recover the electron

$$\Psi_{\nu}^{\{n_{\alpha}\}} = \mathcal{P}_{\text{LLL}} \prod_{\alpha=1}^{k} \Phi_{n_{\alpha}}(\{z_{i}\})$$

k is odd for fermions

$$q_{\alpha} = (-e)\frac{\nu}{n_{\alpha}}, \quad \nu^{-1} = \sum_{\alpha=1}^{k} n_{\alpha}^{-1}$$

$$\stackrel{\Psi^{(n_{\alpha})} = \mathcal{P}_{\text{LLI}} \prod_{\alpha=1}^{k} \Psi_{n_{\alpha}} \text{ partons}}{\stackrel{\Theta^{(n_{\alpha})} = \mathcal{P}_{\text{LLI}} \prod_{\alpha=1}^{k} \Psi_{n_{\alpha}} \text{ partons}}$$

$$\stackrel{\Theta^{(n_{\alpha})} = \mathcal{P}_{\text{LLI}} \prod_{\alpha=1}^{k} \Psi_{n_{\alpha}} \text{ partons}}{\stackrel{\Theta^{(n_{\alpha})} = \mathcal{P}_{\text{LLI}} \prod_{\alpha=1}^{k} \Psi_{n_{\alpha}} \text{ partons}}$$

### secondary Jain $\sim$ primary Jain imes bosonic Laughlin

for 
$$n, p \ge 2$$

$$\begin{array}{lll} \Psi^{\mathrm{Jain}}_{n/(2pn\pm1)} & = & \mathcal{P}_{\mathrm{LLL}} \Phi^{2p}_{1} \Phi_{\pm n} \sim \mathcal{P}_{\mathrm{LLL}} \Phi^{2}_{1} \Phi_{\pm n} \times \Phi^{2(p-1)}_{1} \\ & \sim & \Psi^{\mathrm{Jain}}_{n/(2n\pm1)} \times \Psi^{\mathrm{Laughlin}}_{1/[2(p-1)]} \end{array}$$

The two collective modes are

- CF-exciton/GMP mode of the primary Jain state  $\Psi_{n/(2pn\pm 1)}^{\text{parton}} = \Psi_{n/(2n\pm 1)}^{\text{CFE}} \times \Psi_{1/[2(p-1)]}^{\text{Laughlin}}$
- CF-exciton/GMP mode of the bosonic Laughlin state  $\Psi_{n/(2pn\pm 1)}^{\text{parton}} = \Psi_{n/(2n\pm 1)}^{\text{Jain}} \times \Psi_{1/[2(p-1)]}^{\text{CFE}}$

Ajit C. Balram et al., Phys. Rev. X 12, 021008 (2022)

Ajit C. Balram cb.ajit@gmail.com

### Factorization hardly changes the microscopic wave function

### overlaps between different versions of the projected Jain states

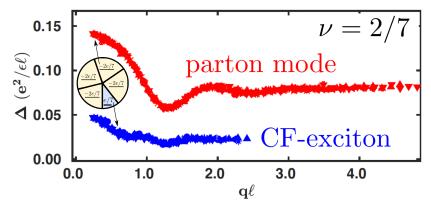

ν	Ν	dimension	$ \langle \Psi^{Jain}_{n/(4n\pm1)} \Psi^{Jain}_{n/(2n\pm1)}  imes \Psi^{Laughlin}_{1/2}  angle $
2/7	8	$5 imes 10^4$	0.9925
2/9	8	$1 imes 10^5$	0.9999

Different versions of the Laughlin wave function have unit overlap with each other since there is no projection involved in the Laughlin states.

Ajit C. Balram and J. K. Jain, Phys. Rev. B 93, 235152 (2016)

・ 同 ト ・ ヨ ト ・ ヨ ト

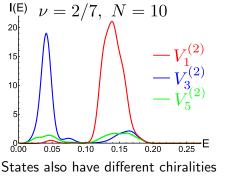

### Trial wave function for the parton mode is accurate

Ajit C. Balram et al., Phys. Rev. X 12, 021008 (2022)

SUSY at  $\nu = 5/2$ 

Clustering properties of the two modes are different 
$$\begin{split} \Psi_{2/7}^{\mathrm{parton-mode}} &= \Psi_{2/3}^{\mathrm{Jain}} \times \Psi_{1/2}^{\mathrm{CFE}} \propto r \text{ high-energy} \\ \Psi_{2/7}^{\mathrm{CFE}} &= \Psi_{2/3}^{\mathrm{CFE}} \times \Psi_{1/2}^{\mathrm{Laughlin}} \propto r^3 \text{ low-energy} \because \langle V_1 \rangle_{\Psi_{2/7}^{\mathrm{CFE}}} = 0 \end{split}$$

Ajit C. Balram et al., Phys. Rev. X 12, 021008 (2022)

< ロ > < 同 > < 三 > < 三 >

Ajit C. Balram cb.ajit@gmail.com

### Parton mode is absent in primary Jain states

- Numerics show only one mode in the primary Jain states.
- All Laughlin fractions, in particular  $\nu = 1/3$ , can support only one mode since the state is made up of only one kind of parton, as each parton fills one LL.
- By particle-hole conjugation in the LLL,  $\nu=2/3$  also hosts only one mode.
- The Jain wave function for 2/5 is analogous to that at 2/3 and thus since 2/3 has only one mode 2/5 is expected to have only one mode.
- Projection removes the parton-like mode  $\mathcal{P}_{LLL}\Phi_{\pm n}\Phi_{1}\Phi_{1}^{exciton}$ .
- A different argument based on geometric fluctuation of conformal Hilbert spaces.

Yuzhu Wang and Bo Yang, Nat. Comm. 14, 2317 (2023)

#### 

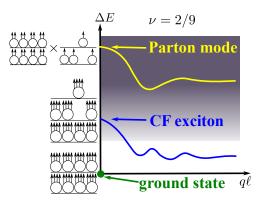

#### Ajit C. Balram cb.ajit@gmail.com

# Outlook

- Very high-energy excitations in the Jain states that are not described by composite fermions but lend themselves to a description in terms of partons.
- How do we experimentally probe these excitations that lie deep in the continuum?
- Can these excitations help identify the underlying topological order in exotic, in particular non-Abelian, states?

### Thanks

Partons are "real" quasiparticles of quantum Hall fluids and like quarks in QCD, show their true "color" only at high energies.

Ajit C. Balram, Zhao Liu, Andrey Gromov, and Zlatko Papić, Phys. Rev. X 12, 021008 (2022)
